

SOUL Installation planning

Plan the kitchen and its utilities together. This guide explains the coordination process; it does not define universal utility positions.

1 / Confirm the composition

Agree the total dimensions, modules, appliance models, sink and faucet. Equipment is specified separately. Share any existing water, drain, power and gas positions at the start of design.

2 / Coordinate utilities

Provide only the services required for the chosen equipment. Worktop cutouts, electrical and gas connections, ventilation and service access depend on the final appliance models. Use the approved project drawing and the appliance manufacturer's instructions.

3 / Prepare the site

Provide a stable, load-bearing support surface, a suitable delivery route and clearance for doors, drawers and equipment maintenance. Confirm total weight, transport sections, support, leveling and handling with the project team.

4 / Final approval

The project drawing confirms exact dimensions and connection locations before production and installation work. Qualified trades carry out the relevant connections. Delivery, unloading, assembly and utility work are defined in the project quotation.
